

Salaries Blockchain

Victor Porton

mathematician and
professional blockchainer

Length of my talk

- I will be short, because I'd say much and I can't say everything anyway.
- I've simply created a concept of a ***new*** kind of smart contract blockchain.
- Many differences from the legacy ones.

Intention

- The project intention is the social and salaries blockchain:
 - common goods
 - salaries
 - free software
 - science
 - carbon/climate, UBI

Features

- most features of Ethereum (using Polkadot's Moonbeam fork)
- no gas token for *equity*
- built-in centralized exchange
- Future Salaries contract (I already have its EVM version) for financing free software, science, climate, UBI, etc.
- even more reliability than the legacy blockchains
- copy-on-write forkery (to be added at a later stage)
- carbon-sucking financial system

Revolution

- That's a revolution: By adding *more* liberty in the world of weird random profits *salaries* and *common goods* appear.

Project Status

- During the hackathon I wrote the project's site content.
- I started to hack Moonbeam earlier.
- I have released a site that expects high traffic recently, I will use it to market the chain. And the chain is a common good that sustains itself!

Ask questions

- I'm Victor Porton, ask questions.
